Merlo: The technological leader in operating machines

Merlo is an important family-run industrial group founded in Cuneo in 1964 that designs, produces and markets its own products under the “Merlo” and “Treemme” brands. People and the territory are at the center of the project; the Merlo Group is committed to respecting the environment and making the work of the operator (and everyone who is passionately dedicated to constantly improving the efficiency and performance of our products) more functional, safe and comfortable.

The product portfolio consists of a complete range of telescopic handlers, both fixed and rotating, DBM self-loading concrete mixers, Treemme municipal and forestry tool carriers and Cingo multi-purpose tracked transporters.

All products in the Merlo range are characterized by innovation, technology and reliability, which have always been distinctive features of the Group and have gained market confidence.
Since 1987, the launch date of the first telehandler in the world with a lateral engine, it was possible to understand that longevity is what characterizes the PANORAMIC range. Over the years, its unique design and construction architecture created by Merlo, has been a source of inspiration for many manufacturers.

The Panoramic range has been constantly enhanced, thanks to the use of exclusive technologies, quality materials and the introduction of safety systems, which are essential in order to offer our customers adequate protection and easy operation.

STABILIZED TELEHANDLER RANGE: Always first in class
Precision and ease of use

The stabilised telehandler range is equipped with front supporting feet, designed to ensure greater stability and safety when handling of loads at great heights, guaranteeing operations in all types of construction sites.

- Frame equipped with independent control stabilizers
- Lift capacity up to 1102 lbs.
- Lift height up to 59 ft.
- Merlo interface for use with over 40 attachments.

USER INTERFACE:
In-cab display for viewing all the operating parameters. Ergonomic Joystick controls with integrated travel-direction selector switch. Cursors and controls are designed to maximize ease of implementation.

POWERTRAIN:
Hydrostatic transmission with permanent four-wheel drive, 75 to 143 HP engines and maximum speed of 25 mph. Exclusive position of the side and longitudinal engine.

BOOM SIDE-SHIFT:
Load positioning correction device without the need to move the machine, nor alter balance and safety of the operator. Unique on the market.

TELESCOPIC BOOM:
Heights from 36-59 ft. with load-bearing capacities from 7700 - 1102 lbs. Exclusive design that ensures lightness, precision and durability. Implement-holder carriage equipped with hydraulic Tac-lock locking system, controllable from the cab.

CAB:
FOPS (Level II) and ROPS certified. The cab is designed to maintain the maximum level of ergonomics while ensuring excellent protection for the operator. The 3.3 (ft.in.) width and the wide glass surface ensure unparalleled comfort and full visibility.

HYDRAULIC SYSTEM:
Sized hydraulic system to minimise manoeuvring times. Variable displacement (Load Sensing) hydraulic pump for maximum efficiency, excellent performance, and perfectly smooth operation.
SAFETY

The exclusive Merlo cab is compliant with the ISO 3449 FOPS (Level II) and ISO 3471 ROPS standards, thus ensuring category-leading safety levels. Merlo’s patented ASCS (Adaptive Stability Control System) is capable of recognizing the attachment being used as well as measuring the magnitude of the load being handled, ensuring operators’ safety. Through the digital display, customers can check all the operating parameters within which the safety system will intervene by slowing down and stopping any problematic movements. Depending on the implement in use, the system is able to vary the response of the machine and the speed of movements. Machine safety is enhanced by an automatic parking brake management system, which brakes the machine if the engine switches off in order to avoid unintentional movements.

MERLO BOOM

Boom consisting of a double “C” profile in high-strength steel with welds made along the neutral bending axis. Hydraulic hoses and electrical wires positioned inside the boom with a “cartridge” system, to protect against any possible impacts and easy extraction in case of maintenance. The L-shaped runner blocks are made of composite material to maximise efficiency and reduce impact and wear on the sliding surfaces. The Merlo boom solution can offer:

- High accuracy with millimetric precision of movement control.
- No bending of the structure.
- Protection of the components and hoses against impacts.
In order to ensure maximum operational safety while handling different tools, the stabilized telehandlers are equipped with cursors that inhibit some hydraulic functions, thus avoiding unintentional operation. For example, if using a winch, it is possible to block the rotation of the carriage by keeping the implement cable at the right angles.

The stabilized telehandlers, apart from the P30.10, are equipped with leveling corrector. This solution is made with two hydraulic cylinders positioned between the frame and the axle, and is able to absorb the transverse inclinations of the ground up to 8%. This ensures a vertical lifting of the load and minimizes the risks of lateral instability of the machine.

A metallic structure, positioned above the glass roof, makes it possible to achieve the most stringent level of certification in terms of protection: FOPS level II. This certification guarantees:

- Perfect comfort in the cab.
- Excellent visibility of the load.
- Maximum operator safety.
- Possibility to easily disassemble the structure for a deeper cleaning of the roof.

Compared to market standards, the frame is characterized by small dimensions, allowing to minimize the overall floor space occupied by the machine. Furthermore, it is equipped, on the outside, with an exclusive steel belt (made from a steel section bar). Designed to maximize structural strength and ensure excellent torsional strength, the underside of the body is completely secured by steel sheets, in order to protect all components from possible impacts during off-road driving.

In order to ensure maximum operational safety while handling different tools, the stabilized telehandlers are equipped with cursors that inhibit some hydraulic functions, thus avoiding unintentional operation. For example, if using a winch, it is possible to block the rotation of the carriage by keeping the implement cable at the right angles.
The ASCS (Adaptive Stability Control System) safety system ensures perfect risk prevention of the machine tipping over frontally when handling a load. The system regulates the speed and maximum degree of movement according to three operating parameters:

- Handled load: lbs. of material lifted.
- Load position: reach, boom extension and carriage rotation.
- Implement in use: automatically recognized by the ASCS system.

When the operational stability limit is reached, the system first reduces the speed of the arm and then stops movement completely. All movements towards a position under safer conditions are permitted during this phase. This simplifies the use of the machine even for less experienced users.

The ASCS can be optionally equipped with a 10.1” color display (standard on Plus models) that allows the operator to view all operating parameters in real time. The high-brightness display has an integrated sensor for automatic adjustment according to external light conditions. In this way, a simple reading of the stability conditions is always ensured, shown in a load diagram that updates, in real time, according to the load being handled and the implement in use. At any time the customer can see at what point the safety system will be triggered. Independent control of each hydraulic movement allows the identification of potentially unsafe situations in the event of an ASCS intervention. In these situations, a pop-up message shows the customer all the movements allowed which are not detrimental to the stability of the vehicle. Finally, the display continuously shows the inclinometer to maximize the safe use of the machine.

**DISPLAY**
WORKING AREA SETTING

A special function, accessible via the display, allows the operator to set the geometric working limits. Adjustment can be made either in accordance with the Cartesian axes (maximum and minimum height and extension) or in accordance with the relative movements of the arm (maximum and minimum lift and extension). This solution makes it possible to simplify and increase safety during repetitive work and operations in confined spaces, such as inside a warehouse.

MOVEMENT SPEED SETTING

The ASCS system uses the display to customize the speed of individual movements of the telescopic boom and the attachments in use according to the needs of individual operators as well as the operations to be carried out. Up to nine different setups can be stored.

FREE ZONE

By equipping the machine with a bucket, which is recognized accordingly, the working free zone is automatically activated. A working area of up to 3 ft. of reach and 10° of lift. Within this area it is possible to operate without the control system blocking the movement of the implement in case of overload, facilitating digging operations and ensuring perfectly smooth movements.

MEMORIZING HANDLED LOADS

Depending on the model, the ASCS display allows the reading of the load being handled, either manually or automatically, whenever the telescopic boom is raised beyond the degrees of inclination pre-set by the operator. The average tolerance on the measured values is ±5% because these can vary depending on the dynamic conditions of the machine. The system can store up to 1,000 different readings, displaying the total and the last 20 values.
PERFORMANCE

Merlo telehandlers are equipped with the latest generation of electronically controlled hydrostatic transmission, which, combined with the four-wheel drive that is always engaged, ensures:
- Excellent braking capacity when the accelerator is released.
- High levels of power and torque to the wheels.
- Unparalleled ease of use.

To complete the transmission, all models are equipped with a two-speed mechanical gearbox. This allows them to reach a maximum speed of 25 mph without compromising precision of movement, ensured by millimetric adjustment of any movements performed.

HYDRAULIC SYSTEM

The only models on the market equipped with two separate circuits for Hydraulics and Hydrostatics. The hydraulic circuit consists of a load sensing variable displacement pump to guarantee ease of use and perform up to three simultaneous movements without difficulty. The hydraulic distributor is mounted to the rear of the frame to reduce vibrations and heat transfer to the cab. At the same time, it increases accessibility for maintenance.

ENGINES

These models feature engines with power ratings ranging from 75 to 102 HP, which, in accordance with the original Merlo design concept, are installed in a longitudinal direction on the right side of the frame. This ensures maximum accessibility to the components during scheduled and/or extraordinary maintenance operations.
This system is built into the machines’ frame, and allows for the lateral movement of the telescopic boom to ensure precise load positioning, with no need for additional maneuvering, thereby saving time, reducing stress, and improving the machine’s productivity.

All stabilized models can be configured with aerial work platform. This solution assures an increased level of active and passive safety during work at heights, and enhances machine versatility.

The Fan Drive is a technology that allows you to change the engine fan’s rotation direction from venting, which cools the radiators, to blowing, which cleans the radiators. It also eliminates dust and residues collected during the work phase, while maintaining the system’s performance and efficiency unaltered.

The axles, manufactured in house by the Merlo Group, are available in two versions: axles with epicyclic reducers, to maximize machine compactness, and axles with portal reducers, to increase ground clearance. Both versions are equipped with four downsized dry disc brakes to ensure high braking capacity and a high level of efficiency that minimizes machine consumption. All bearings and bushings are designed to ensure a longer service life and reduce the need for maintenance.
COMFORT

Acoustic and thermal comfort has also been taken care of down to the smallest details, thanks to intensive research into the most innovative technical solutions and materials. In terms of environmental performance, the entry of dust into the passenger compartment is prevented thanks to the cab’s ISO 10263-3 compliant pressurization.* The Merlo cab is also an extremely comfortable and practical workplace, thanks to the following features:

• 3.3 (ft.in.) of width and excellent roominess
• Large glass surface of 46 sq. ft.
• Vibration-damping Silent-blocks, which reduce noise and vibrations

The set-up is complete with a fabric seat with mechanical suspension. Optionally, the machine can be equipped with air-suspension, raised-back and heated seats.

NOTES:

* pressurization level not approved for use of pesticides, work in hazardous environments, with asbestos, etc.

An unprecedented design guarantees maximum functionality and comfort; the information provided to the driver and the controls of the various systems and devices are grouped for optimal ergonomics. The reverse shuttle on the steering wheel is also present on the Joystick.

1. ASCS display.
2. Capacitive joystick.
3. Steering wheel and transmission controls.
4. Transmission display.
5. Pedal control unit.
6. Accessory compartment and air conditioning controls.
Easy access to the cab is ensured by the 180° opening door, which maximizes entry space, and the large distance between the upright and steering wheel. The side window, which is independent of the door body, can be locked in the open position to maximize air exchange, visibility and direct contact with those working outside near the machine.

Developed according to automotive standards, cutting the warm-up and cool-down times in half compared to a conventional air conditioning system. The intake opening is located on the side of the cab, away from any potential sources of dust and dirt. Inside there are 8 vents, three of which are dedicated to defrosting the windscreens, for optimal climate comfort.

The active boom suspension system (BSS) is available as an option, which protects the load during transfer and maintains a high level of driving comfort on rough terrain. The suspension is automatically deactivated at low speed (below 2 mph), for boom maximum precision and power.

Merlo machines have a carriage that is designed to offer maximum performance in terms of excavation and protection of the main parts, all without compromising on lightness, which is essential for ensuring an exceptional lifting capacity. The maximum rotation greatly facilitates the loading and unloading of material with shovels.

The Tac-lock device, which comes standard on all the models, guarantees maximum operating comfort by allowing the implements to be hydraulically locked directly from the cab.
In combination with the 10.1” color display of the ASCS system, it is possible to equip the machine with an automatically-operated rear camera, when the reverse gear control is engaged. Images from the rear of the telehandler are shown directly on the in-cab display.

The camera can also be activated manually from the ASCS menu.

All telehandlers in this range are equipped with the innovative capacitive electronic joystick control. This instrument is able to detect the presence of the operator’s hand by means of a capacitive type sensor, avoiding the use of a special physical control (“dead man” button) in order to enable the hydraulic movements of the machine. With the joystick it is possible to control all the main hydraulic movements of the machine and implements, with up to 4 independent hydraulic movements on the implement as standard.

The machines can be optionally equipped with a system for regulating and delivering a constant flow of oil to the implements. This solution allows the oil flow to be precisely and specifically adjusted from 0 to maximum flow rate at each of the 4 auxiliary hydraulic outlets at the top of the boom.

All telehandlers in this range are equipped with the innovative capacitive electronic joystick control. This instrument is able to detect the presence of the operator’s hand by means of a capacitive type sensor, avoiding the use of a special physical control (“dead man” button) in order to enable the hydraulic movements of the machine. With the joystick it is possible to control all the main hydraulic movements of the machine and implements, with up to 4 independent hydraulic movements on the implement as standard.

The machines can be optionally equipped with a system for regulating and delivering a constant flow of oil to the implements. This solution allows the oil flow to be precisely and specifically adjusted from 0 to maximum flow rate at each of the 4 auxiliary hydraulic outlets at the top of the boom.
The Merlo cab is equipped with three window cleaning wipers as standard. A front one, for cleaning the windscreen, which can be operated at two speeds depending on the volume of rain. An upper one for cleaning the glass roof and a rear one for cleaning the rear window.

Merlo telehandlers are all fitted as standard with road lights and a rear number plate lighting system. In addition, the range is equipped, as standard, with additional front and rear lights mounted in the upper part of the cab. This solution allows an optimal view of the area in which work is being performed, even in limited light conditions. Finally, optional boom-mounted lights are available to illuminate the load at every stage of lifting.
Merlo telehandlers are the most compact and lightweight models on the market. Excellent maneuverability is ensured by the 4-wheel steering system and the three steering modes, able to reduce maneuvering times for decreased fuel consumption.

- Less space maneuvering needed.
- Greater productivity.
- Less impact on the ground and less fuel consumption.

In order to ensure efficient management of the attachments, all the models feature a double-acting hydraulic service line and an electrical socket for machine-implement communication located at the top of the boom.

As a standard feature, the telehandlers in this range come equipped with an electric and automatic battery switch to improve the efficiency and life of the batteries. Removing the key from the ignition switch starts the process of disconnecting the machine’s electrical circuit. With the circuit off, simply insert the keys into the control panel again to reactivate the batteries.
THREE STEERING WAYS
This exclusive solution adopted on the axles guarantees the maximum steering angle to perform maneuvers in tight spaces.

front wheel steering pivot steering crab steering

VISIBILITY
The improved visibility on the market ensures efficiency in movement and safety for customers, reducing stress for operators who perform numerous maneuvers during the working day. A careful study of the positioning of the cab and boom, as well as a detailed bonnet design and a large glass surface, ensure fast, safe and precise operations.

STABILIZERS
The stabilizers are simply structured to optimize fast and safe installation. The exclusive design of the stabilizers, always in shape, offers high structural strength. This ensures limited footprint during operations, as well as high visibility when driving. The independent control allows the single operation of each stabilizer, enabling a simpler positioning on the ground. Furthermore, the shape of the supporting foot guarantees excellent anchoring to the ground even on soft or steep terrain.

EPD AND AUTO-REVVING JOYSTICK
The exclusive and innovative EPD (Eco Power Drive) transmission and engine control system. The EPD controls and adjusts the engine speed based on the operating conditions, for a reduction in fuel consumption of up to 18%.

Finally, the EPD provides for the control of the engine speed proportionally to the use of the joystick (the greater the inclination of the joystick, the greater the engine revolutions).

This feature further optimizes machine consumption, allowing idle speed to be maintained for longer while maximizing responsiveness for material handling.
STABILIZED TELEHANDLER RANGE

The stabilized telehandler models are developed to meet the specific needs of customers operating in the industrial, construction, and infrastructure sectors. The range great versatility allows us to offer models featuring compact dimensions (suitable for confined construction sites), as well as models with high flow rates and lift heights, able to provide solutions even in very large construction sites. Merlo models can be offered in two versions that differ in their technical and configuration characteristics.
• **ENTRY** Version
The ENTRY models are easy to use and feature a simple interface. Developed to meet the needs of every construction site, as well as rental and large construction companies, they guarantee exceptional performance and economic efficiency. These models' most salient features include:
- Precise and powerful hydraulics with Load Sensing technology
- EPD transmission with maximum speed of 20 mph
- 55 kW/ 75HP heat engine

• **PLUS** Version
The PLUS models have been developed to offer the highest level of technology in terms of efficiency, performance and versatility of use to serve the most demanding operators. These models are all equipped with the ASCS digital display to optimise the information reported to the customer. These models' most salient features include:
- Precise and powerful hydraulics with Load Sensing technology
- EPD transmission with maximum speed of 25 mph
- 85,9kW/116HP heat engine
- TF35.11 TT-145: 105kW/143HP heat engine
ATTACHMENTS

The attachments, which are designed and manufactured at the Merlo Group facilities, are the real operational tools used by Merlo telehandlers, and are designed to bring out the machines’ performance and versatility in different operational situations. The patented recognition of the attachments and the effective Tac-lock hydraulic locking system allow for quick tool changes to be performed, with the operating parameters being configured automatically for maximum safety.

SERVICE & PARTS

Whoever buys a Merlo machine chooses a product that meets the highest standards of quality, reliability and innovation. The customer can count on first-rate support and maintenance services offered by the Merlo Service network, and original spare parts subjected to continuous and rigorous quality controls. Careful and periodic maintenance, combined with the use of original spare parts, will help your telehandler maintain its performance levels over time.

MERLOMOBILITY

The Merlo telehandler range offers exclusive technology, making their telehandlers even smarter and more connected. The MerloMobility 4.0 connectivity system allows the customer to make use of all the information collected by the machines and transferred to the dedicated portal. Merlo Mobility is a flexible tool that allows the user to optimise the operational monitoring of their machines used in various sectors. The MerloMobility system is available as an option on all other Merlo models.
Data, characteristics and illustrations contained in this document are indicative and not binding. Merlo Spa reserves the right to modify characteristics and illustrations and improve products without prior notice. The products shown may include optional equipment.
